(54) Title: TROPANE ANALOGS AND METHODS FOR INHIBITION OF MONOAMINE TRANSPORT

(57) Abstract

New tropane analogs that bind to monoamine transporters are described, particularly, 8-aza, 8-carbo and 8-oxy tropanes having 6- or 7-substituents. The compounds of the present invention can be racemic, pure R-enantiomers, or pure S-enantiomers. Certain preferred compounds of the present invention have a high selectivity for the DAT versus the SERT. Also described are pharmaceutical therapeutic compositions comprising the compounds formulated in a pharmaceutically acceptable carrier and a method for inhibiting 5-hydroxy-tryptamine reuptake of a monoamine transporter by contacting the monoamine transporter with a 5-hydroxytryptamine reuptake inhibiting amount of a compound of the present invention. Preferred monoamine transporters for the practice of the present invention include the dopamine transporter, the serotonin transporter and the norepinephrine transporter.

**Tropane Analogs And Methods For Inhibition of Monoamine  
Transport**

10 **FIELD OF THE INVENTION**

This invention relates to tropane analogs of cocaine and their use as inhibitors of monoamine reuptake.

**BACKGROUND OF THE INVENTION**

15 Cocaine dependence is a problem of national significance. To date no cocaine pharmacotherapy has been reported. Cocaine is a potent stimulant of the mammalian central nervous system. Its reinforcing properties and stimulant effects are associated with its propensity to bind to monoamine transporters, particularly the dopamine transporter (DAT). (Kennedy, L. T. and I. Hanbauer (1983), *J. Neurochem.* 34: 1137-1144; Kuhar, M. J., M. C. Ritz and J. W. Boja (1991), *Trends Neurosci.* 14: 299-302; Madras, B. K., M. A. Fahey, J. Bergman, D. R. Canfield and R. D. Spealman (1989), *J. Pharmacol. Exp. Ther.* 251: 131-141; Madras, B. K., J. B. Kamien, M. Fahey, D. Canfield, et al. (1990), *Pharmacol Biochem Behav.* 35: 949-953; Reith, M. E. A., B. E. Meisler, H. Sershen and A. Lajtha (1986), *Biochem. Pharmacol.* 35: 1123-1129; Ritz, M. C., R. J. Lamb, S. R. Goldberg and M. J. Kuhar (1987), *Science* 237: 1219-1223; Schoemaker, H., C. Pimoule, S. Arbillia, B. Scatton, F. Javoy-Agid and S. Z. Langer (1985), *Naunyn-Schmiedeberg's Arch. Pharmacol.* 329: 227-235.) It also binds with substantial potency to serotonin 30 transporters (SERT) and norepinephrine transporters.

Structure activity relationship (SAR) studies have largely focused on a series of cocaine analogs. Among the more potent of these congeners at  $^3\text{H}$ -cocaine binding sites in striatum (Madras, B. K., M. A. Fahey, J. Bergman, D.

R. Canfield and R. D. Spealman (1989), *J. Pharmacol. Exp. Ther.* 251: 131-141; Reith, M. E. A., B. E. Meisler, H. Sershen and A. Lajtha (1986), *Biochem. Pharmacol.* 35: 1123-1129) is (1*R*)-3 $\beta$ -(4-fluorophenyl)tropane-2 $\beta$ -carboxylic acid methyl ester, (WIN35,428 or CFT) (Kaufman, M. J. and B. K. Madras (1992), *Synapse* 12: 99-111; Madras, B. K., M. A. Fahey, J. Bergman, 5 D. R. Canfield and R. D. Spealman (1989), *J. Pharmacol. Exp. Ther.* 251: 131-141) reported in 1973 (Clarke, R. L., S. J. Daum, A. J. Gambino, M. D. Aceto, et al. (1973), *J. Med. Chem.* 16: 1260-1267). This compound was subsequently radiolabeled to provide a selective probe for the DAT in primate 10 brain. (Canfield, D. R., R. D. Spealman, M. J. Kaufman and B. K. Madras (1990), *Synapse* 6: 189-195; Kaufman, M. J. and B. K. Madras (1991), *Synapse* 9: 43-49; Kaufman, M. J., R. D. Spealman and B. K. Madras (1991), *Synapse* 9: 177-187.)

Among the most potent tropane inhibitors of monoamine binding sites 15 in striatum are 3 $\beta$ -(4-(1-methylethenyl)-phenyl)-2 $\beta$ -propanoyl-8-azabicyclo(3.2.1)octane and 3 $\beta$ -(2-naphthyl)-2 $\beta$ -propanoyl-8-azabicyclo(3.2.1)octane, (Bennett, B. A., C. H. Wichems, C. K. Hollingsworth, H. M. L. Davies, C. Thornley, T. Sexton and S. R. Childers (1995), *J. Pharm. Exp. Ther.* 272: 1176-1186; Davies, H. M. L., L. A. Kuhn, C. 20 Thornley, J. J. Matasi, T. Sexton and S. R. Childers (1996), *J. Med. Chem.* 39: 2554-2558) (1*R*)-RTI55 ( $\beta$ CIT), (Boja 1991; Boja, J. W., A. Patel, F. I. Carroll, M. A. Rahman, et al. (1991), *Eur. J. Pharmacol.* 194: 133-134; Neumeyer, J. L., S. Wang, R. A. Milius, R. M. Baldwin, et al. (1991), *J. Med. Chem.* 34: 3144-3146) (1*R*)-RTI121, (Carroll, F. I., A. H. Lewin, J. W. Boja and M. J. 25 Kuhar (1992), *J. Med. Chem.* 35: 969-981.) and (1*R*)-3 $\beta$ -(3,4-di-chlorophenyl)-tropane-2 $\beta$ -carboxylic acid methyl ester (O-401), (Carroll, F. I., M. A. Kuzemko and Y. Gao (1992), *Med. Chem Res.* 1: 382-387; Meltzer, P. C., A. Y. Liang, A.-L. Brownell, D. R. Elmalem and B. K. Madras (1993), *J. Med. Chem.* 36: 855-862).

30 SAR studies of the binding of these agents and their effects on monoamine transporter function have been reported. (Blough, B. E., P.

Binding of cocaine and its tropane analogs to monoamine transporters is stereoselective. As example (*1R*)-(-)-cocaine binds at the dopamine transporter about 200-fold more potently than the unnatural isomer, (*1S*)-(+)-cocaine. (Kaufman, M. J. and B. K. Madras (1992), *Synapse* 12:

99-111; Madras, B. K., M. A. Fahey, J. Bergman, D. R. Canfield and R. D. Spealman (1989), *J. Pharmacol. Exp. Ther.* 251: 131-141; Madras, B. K., R. D. Spealman, M. A. Fahey, J. L. Neumeyer, J. K. Saha and R. A. Milius (1989), *Mol. Pharmacol.* 36: 518-524; Reith, M. E. A., B. E. Meisler, H. Sershen and A. Lajtha (1986), *Biochem. Pharmacol.* 35: 1123-1129; Ritz, M. C., R. J. Lamb, S. R. Goldberg and M. J. Kuhar (1987), *Science* 237: 1219-1223.)

Also, only the *R*-enantiomers of cocaine have been found active in a variety of biological and neurochemical measures. (Clarke, R. L., S. J. Daum, A. J. Gambino, M. D. Aceto, et al. (1973), *J. Med. Chem.* 16: 1260-1267; Kaufman, M. J. and B. K. Madras (1992), *Synapse* 12: 99-111; Madras, B. K., M. A. Fahey, J. Bergman, D. R. Canfield and R. D. Spealman (1989), *J. Pharmacol. Exp. Ther.* 251: 131-141; Madras, B. K., R. D. Spealman, M. A. Fahey, J. L. Neumeyer, J. K. Saha and R. A. Milius (1989), *Mol. Pharmacol.* 36: 518-524; Reith, M. E. A., B. E. Meisler, H. Sershen and A. Lajtha (1986), *Biochem. Pharmacol.* 35: 1123-1129; Ritz, M. C., R. J. Lamb, S. R. Goldberg and M. J. Kuhar (1987), *Science* 237: 1219-1223; Sershen, H., M. E. A. Reith and A. Lajtha (1980), *Neuropharmacology* 19: 1145-1148; Sershen, H., M. E. A. Reith and A. Lajtha (1982), *Neuropharmacology* 21: 469-474; Spealman, R. D., R. T. Kelleher and S. R. Goldberg (1983), *J. Pharmacol. Exp. Ther.* 225: 509-513.) Parallel stereoselective behavioral effects have also been observed. (Bergman, J., B. K. Madras, S. E. Johnson and R. D. Spealman (1989), *J. Pharmacol. Exp. Ther.* 251: 150-155; Heikkila, R. E., L. Manzino and F. S. Cabbat (1981), *Subst. Alcohol Actions/Misuse* 2: 115-121; Reith, M. E. A., B. E. Meisler, H. Sershen and A. Lajtha (1986), *Biochem. Pharmacol.* 35: 1123-1129; Spealman, R. D., R. T. Kelleher and S. R. Goldberg (1983), *J. Pharmacol. Exp. Ther.* 225: 509-513; Wang, S., Y. Gai, M. Laruelle, R. M. Baldwin, B. E. Scanlet, R. B. Innis and J. L. Neumeyer (1993), *J. Med. Chem.* 36: 1914-1917.) For example, in primates and rodents the stimulating and reinforcing properties of the (-)-enantiomer of cocaine or its 3-aryltropane analogs were considerably greater than for the (+)-enantiomers.

Although SAR studies of cocaine and its 3-aryltropane analogs have

offered insight into their mode of binding to monoamine transporters, a comprehensive picture of the binding interaction at the molecular level has not emerged. SAR studies on the classical tropane analogs (Carroll, F. I., Y. Gao, M. A. Rahman, P. Abraham, et al. (1991), *J. Med. Chem.* 34: 2719-2725; Carroll, F. I., S. W. Mascarella, M. A. Kuzemko, Y. Gao, et al. (1994), *J. Med. Chem.* 37: 2865-2873; Madras, B. K., M. A. Fahey, J. Bergman, D. R. Canfield and R. D. Spealman (1989), *J. Pharmacol. Exp. Ther.* 251: 131-141; Madras, B. K., R. D. Spealman, M. A. Fahey, J. L. Neumeyer, J. K. Saha and R. A. Milius (1989), *Mol. Pharmacol.* 36: 518-524; Meltzer, P. C., A. Y. Liang, A.-L. Brownell, D. R. Elmaleh and B. K. Madras (1993), *J. Med. Chem.* 36: 855-862; Reith, M. E. A., B. E. Meisler, H. Sershen and A. Lajtha (1986), *Biochem. Pharmacol.* 35: 1123-1129) appeared to provide a consistent model for this interaction with the DAT, however, subsequent studies revealed inconsistencies. (Carroll, F. I., P. Kotian, A. Dehghani, J. L. Gray, et al. (1995), *J. Med. Chem.* 38: 379-388; Chen, Z., S. Izewasser, J. L. Katz, N. Zhu, C. L. Klein and M. L. Trudell (1996), *J. Med. Chem.* 39: 4744-4749; Davies, H. M. L., L. A. Kuhn, C. Thornley, J. J. Matasi, T. Sexton and S. R. Childers (1996), *J. Med. Chem.* 39: 2554-2558; Kozikowski, A. P., G. L. Araldi and R. G. Ball (1997), *J. Org. Chem.* 62: 503-509; Meltzer, P. C., A. Y. Liang and B. K. Madras (1994), *J. Med. Chem.* 37: 2001-2010; Meltzer, P. C., A. Y. Liang and B. K. Madras (1996), *J. Med. Chem.* 39: 371-379.)  
Carroll had proposed (Boja, J. W., R. M. McNeill, A. Lewin, P. Abraham, F. I. Carroll and M. J. Kuhar (1992), *Mol. Neurosci.* 3: 984-986; Carroll, F. I., P. Abraham, A. Lewin, K. A. Parham, J. W. Boja and M. J. Kuhar (1992), *J. Med. Chem.* 35: 2497-2500; Carroll, F. I., Y. Gao, M. A. Rahman, P. Abraham, et al. (1991), *J. Med. Chem.* 34: 2719-2725; Carroll, F. I., M. A. Kuzemko and Y. Gao (1992), *Med. Chem. Res.* 1: 382-387) four molecular requirements for binding of cocaine and its tropane analogs at the DAT: a  $2\beta$ -carboxy ester, a basic nitrogen capable of protonation at physiological pH, the *R*-configuration of the tropane and a  $3\beta$ -aromatic ring at C<sub>3</sub>. However, Davies (Davies, H. M. L., E. Saikali, T. Sexton and S. R. Childers (1993), *Eur. J. Pharmacol. Mol.*

*Pharm.* 244: 93-97) later reported that introduction of 2 $\beta$ -ketones did not reduce potency. Kozikowski questioned the role of hydrogen bonding at the C<sub>2</sub> site because introduction of unsaturated and saturated alkyl groups (Kozikowski, A. P., M. Roberti, K. M. Johnson, J. S. Bergmann and R. G. Ball 5 (1993), *Bioorg. Med. Chem. Lett.* 3: 1327-1332; Kozikowski, A. P., M. Roberti, L. Xiang, J. S. Bergmann, P. M. Callahan, K. A. Cunningham and K. M. Johnson (1992), *J. Med. Chem.* 35: 4764-4766) did not diminish binding. Further, the ionic bond between a protonated amine (at physiologically pH) and the presumed (Kitayama, S., S. Shimada, H. Xu, L. Markham, D. H. 10 Donovan and G. R. Uhl (1993), *Proc. Natl. Acad. Sci. U.S.A.* 89: 7782-7785) aspartate residue on the DAT was questioned because reduction of nitrogen nucleophilicity (Kozikowski, A. P., M. K. E. Saiah, J. S. Bergmann and K. M. Johnson (1994), *J. Med. Chem.* 37(37): 3440-3442) by introduction of N-sulfones did not reduce binding potency.

15 It also has been reported (Madras, B. K., J. B. Kamien, M. Fahey, D. Canfield, et al. (1990), *Pharmacol Biochem. Behav.* 35: 949-953) that introduction of an alkyl or allyl group did not eliminate binding potency. An N-iodoallyl group on the tropane has provided potent and selective ligands for the DAT, and altropine is currently being developed as a SPECT imaging agent (Elmaleh, D. R., B. K. Madras, T. M. Shoup, C. Byon, et al. (1995), *J. Nucl. Chem.*, 37 1197-1202 (1995); Fischman, A. J., A. A. Bonab, J. W. Babich, N. M. Alpert, et al. (1996), *Neuroscience-Net* 1, 00010, (1997). A <sup>99m</sup>technetium labeled compound, technepine, which binds potently and selectively to the DAT and provides excellent *in vivo* SPECT images has been 20 reported. (Madras, B. K., A. G. Jones, A. Mahmood, R. E. Zimmerman, et al. (1996), *Synapse* 22: 239-246.) (Meltzer, P.C., Blundell, P., Jones, A.G., Mahmood, A., Garada, B. et al., *J. Med. Chem.*, 40, 1835-1844, (1997). 2-Carbomethoxy-3-(bis(4-fluorophenyl)methoxy)tropanes have been reported 25 (Meltzer, P. C., A. Y. Liang and B. K. Madras (1994), *J. Med. Chem.* 37: 2001-2010). The S-enantiomer, (S)-(+)-2 $\beta$ -carbamethoxy-3 $\alpha$ -(bis(4-fluorophenyl)methoxy)tropane 30

(Difluoropine) was considerably more potent ( $IC_{50}$ : 10.9 nM) and selective (DAT v. SERT: 324) than any of the other seven isomers, including the R-enantiomers.

Drug therapies for cocaine abuse are needed. Also, there is a need for protective agents for neurodegenerative diseases such as Parkinson's disease and Alzheimer's disease as well as therapeutic agents for dopamine related dysfunction such as Attention Deficit Disorder. Compounds that inhibit monoamine reuptake in the mammalian system are sought to provide such therapies.

Inhibition of 5-hydroxytryptamine reuptake has an effect on diseases mediated by 5HT receptors. Compounds that provide such inhibition can be useful, for example, as therapeutic anti-depressants.

Cocaine recognition sites are localized on monoamine transporters such as, for example, the dopamine transporter (DAT) and serotonin transporter (SERT). These transporters are localized, in turn, on monoamine nerve terminals. Compounds that bind to these sites can be useful as (i) probes for neuro-degenerative diseases (e.g., Parkinson's disease), (ii) therapeutic drugs for neurodegenerative diseases (e.g., Parkinson's and Alzheimer's disease), (iii) therapeutic drugs for dopamine dysfunction (e.g., Attention Deficit Disorder), (iv) treatment of psychiatric dysfunction (e.g., depression) and (v) treatment of clinical dysfunction (e.g., migraine).

#### SUMMARY OF THE INVENTION

The compounds of this invention are new tropane analogs that bind to monoamine transporters. Thus, the present invention provides tropane analogs having one of the following formula:

The substituents at the 2 and 3 position of the ring can be α- or β-.

Although R<sub>1</sub> is illustrated in the 2- position, it should be recognized that substitution at the 3- position is also included and the position is dependent on the numbering of the tropane ring. The compounds of the present invention can be racemic, pure R-enantiomers, or pure S-enantiomers. Thus, the structural formulas illustrated herein are intended to represent each enantiomer and diastereomer of the illustrated compound.

15 The compounds of the present invention can be radiolabelled, for example, to assay cocaine receptors. Certain preferred compounds of the present invention have a high selectivity for the DAT versus the SERT.

20 The present invention also provides pharmaceutical therapeutic compositions comprising the compounds formulated in a pharmaceutically acceptable carrier.

25 Further, the invention provides a method for inhibiting 5-hydroxytryptamine reuptake of a monoamine transporter by contacting the monoamine transporter with a 5-hydroxy-tryptamine reuptake inhibiting (5-HT inhibiting) amount of a compound of the present invention. Inhibition of 5-hydroxy-tryptamine reuptake of a monoamine transporter in a mammal is provided in accord with the present invention by administering to the mammal a 5-HT inhibiting amount of a compound of the present invention in

a pharmaceutically acceptable carrier. Preferred monoamine transporters for the practice of the present invention include the dopamine transporter, the serotonin transporter and the norepinephrine transporter.

In a preferred embodiment, the invention also provides a method for 5 inhibiting dopamine reuptake of a dopamine transporter by contacting the dopamine transporter with a dopamine reuptake inhibiting amount of a compound of the present invention. Inhibition of dopamine reuptake of a dopamine transporter in a mammal is provided in accord with the present invention by administering to the mammal a dopamine inhibiting amount of a 10 compound of the present invention in a pharmaceutically acceptable carrier.

The term "lower alkyl" when used herein designates aliphatic saturated branched or straight chain hydrocarbon monovalent substituents containing from 1 to about 8 carbon atoms such as methyl, ethyl, isopropyl, n-propyl, n-butyl,  $(CH_2)_nCH_3$ ,  $C(CH_3)_3$ ; etc., more preferably 1 to 4 carbons. The term 15 "lower alkoxy" designates lower alkoxy substituents containing from 1 to about 8 carbon atoms such as methoxy, ethoxy, isopropoxy, etc., more preferably 1 to 4 carbon atoms.

The term "lower alkenyl" when used herein designates aliphatic unsaturated branched or straight chain vinyl hydrocarbon substituents 20 containing from 2 to about 8 carbon atoms such as allyl, etc., more preferably 2 to 4 carbons. The term "lower alkynyl" designates lower alkynyl substituents containing from 2 to about 8 carbon atoms, more preferably 2 to 4 carbon atoms such as, for example, propyne, butyne, etc.

The terms substituted lower alkyl, substituted lower alkoxy, 25 substituted lower alkenyl and substituted lower alkynyl, when used herein, include corresponding alkyl, alkoxy, alkenyl or alkynyl groups substituted with halide, hydroxy, carboxylic acid, or carboxamide groups, etc. such as, for example,  $-CH_2OH$ ,  $-CH_2CH_2COOH$ ,  $-CH_2CONH_2$ ,  $-OCH_2CH_2OH$ ,  $-OCH_2COOH$ ,  $-OCH_2CH_2CONH_2$ , etc. As used herein, the terms lower alkyl, lower alkoxy, lower alkenyl and 30 lower alkynyl are meant to include where practical substituted such groups

as described above.

When X contains a carbon atom as the ring member, reference to X is sometimes made herein as a carbon group. Thus, when X is a carbon group, as that phrase is used herein, it means that a carbon atom is a ring member at the X position (i.e., the 8- position).

#### DETAILED DESCRIPTION OF THE INVENTION

In accord with the present invention, novel tropane compounds are provided that bind to monoamine transporters, preferably the DAT. Certain preferred compounds also have a high selectivity for the DAT versus the SERT. In one preferred embodiment of the present invention, tropane analogs are provided having substituents in the 6- or 7- position of the tropane structure. Preferred compounds of this embodiment of the invention include

those having the formula:

IV.

5

where X, Ar, R<sub>2</sub> and m have the same meaning as defined above. Particularly preferred compounds have X includes a nitrogen, carbon or oxygen atom as a ring member, R<sub>2</sub> is hydrogen, hydroxy or methoxy, and Ar is phenyl, substituted phenyl such as mono- or di-halogen substituted phenyl, or a diarylmethoxy including halogen substituted such groups.

For example, 6- and 7-hydroxy-8-azatropanes of the present invention can be prepared as shown in Scheme 1 (FIG. 1). Synthesis of these 6- and 7-oxygenated tropanes in accord with Scheme 1 is based upon a Mannich reaction. (Robinson, R. (1917), *J. Chem. Soc.* 111: 762.) Dimethoxydihydropyran 1, is stirred for 12h (hours) in 3N HCl and then neutralized by addition of aqueous NaOH. Methylamine hydrochloride in water, and acetone-dicarboxylic acid anhydride 2 in MeOH are added. A mixture of 6- and 7-hydroxy, 3β-keto esters 3 and 4 is obtained. The exo (β) stereochemistry of the hydroxyl group at C<sub>6</sub> (3), or C<sub>7</sub> (4), is confirmed by NMR studies.

Chromatographic separation also provides 6- and 7-methoxy compounds 12 and 13. The 6- and 7-hydroxy β-keto esters 3 and 4 are each methoxymethylated with dimethoxymethane and pTSA to provide 5. Although both 6- and 7-substituted compounds are taken through the following sequence of reactions, Scheme 1 illustrates the reaction scheme for the 7-substituted compound. Subsequent conversion (Carroll, F. I., P. Kotian, A. Dehghani, J. L. Gray, et al. (1995), *J. Med. Chem.* 38: 379-388; Keverline, K. I., P. Abraham, A. H. Lewin and F. I. Carroll (1995), *Tetrahedron Lett.* 36: 3099-3102) to the enol triflate 6 is achieved with sodium bis(trimethylsilyl) amide and phenyl triflimide. The alkenes 7 are then obtained (85%) by

Suzuki coupling of the triflates with 3,4-dichlorophenyl boronic acid. Reduction of 7 with  $\text{SmI}_2$  at  $-78^\circ\text{C}$ , in the presence of MeOH, and subsequent chromatography affords the saturated tropanes, 8 (61%) and 9 (20%). Compound 8 exists in a twist-boat conformation while compound 9 assumes a twist-chair conformation. Finally, the methoxymethyl (MOM) group of each of 8 and 9 is removed in high yield (85%) with trimethylsilyl bromide in  $\text{CH}_2\text{Cl}_2$  at  $0^\circ\text{C}$  to give the corresponding hydroxy tropanes 10 and 11. (Chen, Z., S. Izenwasser, J. L. Katz, N. Zhu, C. L. Klein and M. L. Trudell (1996), *J. Med. Chem.* 39: 4744-4749; #214.) The alkene 7 can be treated in the same manner to remove the MOM group at that stage and provide a 6- or 7-substituted unsaturated tropane analog.

Esters can be obtained by acylation with suitable acid chlorides or anhydrides. The 7- (and 6-) methoxy,  $3\beta$ -keto esters 12 (and 13) are transformed into their enol triflates and analogous transformations then provide the methoxy tropanes 14 and 15.

Biological data for representative 2-carbomethoxy-3-(3,4-diphenyl)tropanes of the present invention are shown in Table 1.

Table 1. Inhibition of  $^3\text{H}$ -WIN35,428 binding to the DAT and  $^3\text{H}$ -citalopram binding to the SERT: cynomolgus monkey caudate-putamen

Compound	R	DAT	SERT	IC <sub>50</sub> (nM)		Selectivity
				DATV.SERT		
10	3 $\alpha$ (boat)	OH	1	1,450	1,450	
11	3 $\beta$ (chair)	OH	1	20	20	
15	3 $\alpha$ (boat)	OCH <sub>3</sub>	92	5,215	57	
14	3 $\beta$ (chair)	OCH <sub>3</sub>	86	884	10	

The 7-OH compounds can exhibit extremely potent and selective

binding for the DAT. Thus, compound **10** manifests an  $IC_{50} < 2$  nM and high selectivity (DAT v. SERT > 500) and the  $3\beta$  compound **11** is equally potent at the DAT ( $IC_{50} = 1$  nM) but less selective (DAT v. SERT = 20). Whereas the parent compound 2-carbomethoxy-3,4-di-chlorophenyltropane is potent, ( $IC_{50} = 1.09$  nM) but lacks selectivity (DAT v. SERT = 2), the  $7\beta$ -hydroxy compounds surprisingly retain potency and are also considerably more selective (DAT v. SERT = 20 for  $3\beta$  (chair), = 1450 for  $3\alpha$  (boat)). Introduction of the  $7\beta$ -hydroxyl group has significantly and unexpectedly improved the selectivity of these compounds for the DAT.

10 These compounds are racemic. The pure enantiomers, compound **10** and compound **11**, are synthesized enantiopure. Resolution is achieved by formation of the diastereomeric tartrate salts of compound **5** or by formation and separation of diastereomeric enol camphanates. Thus, the tartrate salt of protected (MOM or AcO) compound **5** is recrystallized by standard methods, 15 well known to those skilled in the art, to provide each of the diastereomeric salts. Treatment with base provides enantiopure (*1R*)-compound **5** and (*1S*)-compound **5**. Alternatively, formation of the diastereomeric enol camphanates esters of compound **5**, recrystallization, and hydrolysis with LiOH also provides enantiopure (*1R*)-compound **5** and (*1S*)-compound **5**.  
20 These enantiopure ketones are carried through the sequence to provide the enantiopure target compounds. Thus,  $3\beta$  (chair) and  $3\alpha$  (boat) hydroxytropanes or various analogous alkoxytropanes can be prepared.

The potency of the 7-hydroxy and 7-methoxy anaologs of 2-carbomethoxy-3-(3,4-diphenyl tropane,  $3\beta$  (chair) and  $3\alpha$  (boat), shown in 25 Table 1, were determined by the Dopamine Transporter Assay and Serotonin Transporter Assay described hereinafter.

The preparation of 3-diarylmethoxytropanes is illustrated in Scheme 2 using a 7-substituted,  $3\beta$ -keto tropane to make the corresponding  $7\beta$ -OH compound (see FIG. 2). The  $7\alpha$ -OH (as well as  $6\alpha$ -OH and  $6\beta$ -OH) compounds 30 are carried through an identical sequence. Other 3-aryloxytropanes can be

made by analogous reaction schemes. Synthesis of the  $7\beta$ -OH compound **21** is based upon prior synthetic routes. Thus, the MOM protected (*1S*)-keto ester **5** is reduced with LiBH(Bu<sup>i</sup>)<sub>3</sub> in tetrahydrofuran (THF) to provide the  $2\beta$ -COOCH<sub>3</sub>- $3\alpha$ -OH compound **19**. Alternatively, reduction can be conducted  
5 with NaBH<sub>4</sub>, to provide a mixture of the  $2\alpha$ ,  $2\beta$ , and  $3\alpha$ ,  $3\beta$  substituted compounds. The  $2\alpha$ -COOCH<sub>3</sub>- $3\alpha$ -OH compound can be inverted upon treatment with NaHCO<sub>3</sub> to provide the preferred  $2\beta$ -COOCH<sub>3</sub>- $3\alpha$ -OH **19**. Reaction of compound **19** with diarylmethyl chloride (van der Zee 1980) gives the MOM protected compound **20** which is deprotected with trimethylsilyl  
10 bromide (TMSBr) in CH<sub>2</sub>Cl<sub>2</sub> to yield the desired target compounds **21**. The aryl ring can be substituted with one or more halide atoms, preferably chloride or iodide, hydroxy groups, nitro groups, amino groups including mono- and di- alkyl substituted groups having from 1-8 carbon atoms, cyano groups, lower alkyl groups having from 1-8 carbon atoms, lower alkoxy  
15 groups having from 1-8 carbon atoms, lower alkenyl groups having from 2-8 carbon atoms, lower alkynyl groups having from 2-8 carbon atoms, and combinations of such substituents. Preferred aryl groups have substituents including Br, Cl, I, F, OH, OCH<sub>3</sub>, CF<sub>3</sub>, NO<sub>2</sub>, NH<sub>2</sub>, CN, NHCOCH<sub>3</sub>, N(CH<sub>3</sub>)<sub>2</sub>, (CH<sub>2</sub>)<sub>n</sub>CH<sub>3</sub> where n= 0-6, COCH<sub>3</sub>, C(CH<sub>3</sub>)<sub>3</sub>, 4-F, 4-Cl, 4-I, 2-F, 2-Cl, 2-I, 3-F,  
20 3-Cl, 3-I, 3,4-diCl, 3,4-diOH, 3,4-diOAc, 3,4-diOCH<sub>3</sub>, 3-OH-4-Cl, 3-OH-4-F, 3-Cl-4-OH, 3-F-4-OH, allyl, isopropyl and isobutyl.

Potent "6,7-bridge" hydroxy compounds of the tropane analogs of the present invention, e.g., the 8-aza family, can be demethylated and realkylated with a variety of alkyl and alkyl aryl groups. Thus, for example **21** is treated  
25 with ACE-Cl to provide the nor compound or demethylation can be conducted prior to deprotection by treatment of **20** with ACE-Cl in presence of 2,6-lutidine. Reaction with suitable alkyl chlorides in the presence of K<sub>2</sub>CO<sub>3</sub> or alternately with KF/celite then provides N-substituted compounds such as N-(CH<sub>2</sub>)<sub>n</sub>-Ar (n=1-3; Ar=phenyl or halophenyl). The MOM group is removed  
30 with TMSBr.

8-oxatropanes, in accord with the present invention, can be potent

inhibitors of monoamine transporters. 6- and 7-Hydroxy-8-oxa-3-aryl tropanes are particularly preferred compounds of the present invention. Examples of such preferred compounds of the present invention have the following formula:

5 V.

10

where R is preferably H, 4-F, 4-Cl, 4-Br, 4-I, 4-CH<sub>3</sub>, or the aryl group is a 3,4 dihalo substituted phenyl such as, for example, 3,4-dichloro.

The syntheses of 8-oxatropanes can be accomplished by either of the two routes (Schemes 3 and 4) illustrated herein. Thus, following Scheme 3 (FIG. 3), the ketone 22, prepared as described by Lampe and Hoffman (*Chem. Commun.* (1996): 1931-1932) is protected as the ketal 23 (ethylene glycol, *p*-toluene sulfonic acid (*p*TSA)) and then hydroborated with LiBH(Bu<sup>i</sup>)<sub>3</sub> (Bu<sup>i</sup> = iso-butyl) followed by oxidative work-up with alkaline H<sub>2</sub>O<sub>2</sub> (Lautens, M. and S. Ma (1996), *Tetrahedron Lett.* **37**: 1727-1730) to provide the ketone 24 (X=H). Protection with dimethoxymethane and *p*TSA then provides protected compound 24 (X=MOM). Introduction of the 2-COOCH<sub>3</sub> group is effected with dimethylcarbonate and sodium hydride (Meltzer, P. C., A. Y. Liang and B. K. Madras (1994), *J. Med. Chem.* **37**: 2001-2010) to provide compound 25 (X=MOM). Introduction of this 2-COOCH<sub>3</sub> group is not specific. However, this is an advantage because racemic 2-COOCH<sub>3</sub>-oxabicycles, both 6- and 7-substituted, are obtained. These positional isomers are separable by column chromatography. Resolution is accomplished through the enol camphanate route described earlier. Conversion to the enol triflate 26 is accomplished

with sodium bistrimethyl-silyl amide and phenyl triflimide. Suzuki coupling of the triflates with the relevant aryl boronic acid obtains the alkenes 27. Reduction of 27 with SmI<sub>2</sub> at -78°C, with MeOH as the proton source, and subsequent chromatography affords the saturated protected oxabicycles 28 and 29. Finally, the MOM group of each of 28 and 29 is removed with trimethylsilyl bromide in CH<sub>2</sub>Cl<sub>2</sub> at 0°C to give the corresponding hydroxy tropanes 28 (X=H) and 29 (X=H). Deprotecting compound 27 can make the corresponding unsaturated oxatropanes.

Alternatively, using the longer route (Scheme 4), the ketone 22 is converted to the benzyl protected alcohol 31. Both the (-)-compound 31 and the (+)-compound 31 have been prepared in >96% ee by use of (-)-(Ipc)<sub>2</sub>BH or (+)-(Ipc)<sub>2</sub>BH respectively. (Lampe, T. F. J. and H. M. R. Hoffmann (1996), *Chem. Commun.* : 1931-1932.) Protection of the hydroxy group with dimethoxymethane and pTSA provides compound 32 (X=MOM). Catalytic hydrogenolysis then provides the 3-ol compound 33. Oxidation under mild Dess-Martin conditions (Dess, D. B. and J. C. Martin (1983). *J. Org. Chem.* 48: 4155) gives the desired ketones 34 (X=MOM) which are carried through the sequence described above to provide compounds 28 and 29.

In another preferred embodiment of the present invention, preferred 8-oxatropanes and 8-carbatropanes include those having alkenyl and alkynyl groups on the 3-aryl ring, particularly of the 2-COOCH<sub>3</sub> tropanes, to enhance potency at the SERT. Particularly preferred examples of such compounds have the following formula:

## VI.

25

30

where X is an oxygen or a carbon group such as, for example, CH<sub>2</sub>, CHY,

CYY<sub>1</sub>, CO, or C=CX<sub>1</sub>Y where X<sub>1</sub>, Y and Y<sub>1</sub> are defined above, and R<sub>7</sub> is a lower alkenyl or lower alkynyl group having from about 2 to about 8 carbon atoms. Particularly preferred lower alkenyl and lower alkynyl groups are ethenyl, propenyl, butenyl, propynyl, butynyl and methylpropynyl.

- 5      Introduction of such functionality in the 8-oxa compounds can be accomplished following the reported synthetic route for the 8-aza compounds. (Blough, B. E., P. Abraham, A. H. Lewin, M. J. Kuhar, J. W. Boja and F. I. Carroll (1996), *J. Med. Chem.* **39**: 4027-4035.) Iodo compounds are prepared as precursors for the 4-alkenyl and 4-alkynyl compounds shown in Scheme 5
- 10     (see FIG. 5). Reduction of the octenes **47** (Scheme 6) (R=I) with SmI<sub>2</sub> in THF/MeOH at -78°C provides a mixture of the 3β and 3α compounds **35**. In general, when trifluoroacetic acid is used, the major products are the 2β, 3α-boat conformers. The minor products are the 2β, 3β-chair conformers. With water as proton source, a 1:1 mixture is generally obtained. Chemical
- 15     shift, coupling constants, and nuclear Overhauser effect ("nOe") analyses confirm that the 2β-carbomethoxy compounds are exclusively obtained upon SmI<sub>2</sub> reduction of the octenes. Only 3β compounds are presented in the scheme. However, compounds in 3α and 3β conformation are similarly prepared. Racemates and enantiopure compounds can also be prepared by
- 20     similar techniques well known to those skilled in the art. Compound **35** is reacted with CuI and bis(triphenyl-phosphine)palladium (II) chloride and trimethyl silylacetylene. The product is desilylated with t-butyl ammonium fluoride to provide the 4-alkynyl compounds **39a**. The same reaction, using propyne, provides compound **39b**, although no deprotection is required here.
- 25     Reduction of compound **39b** over Lindlar's catalyst at 60 psi provides the Z-ene **40**. The E-ene **38** is obtained via the allyl compound **37**. Thus, compound **35** is reacted with allyltributyltin and tetrakis(triphenyl-phosphine)palladium to provide compound **37**, which is quantitatively isomerized to compound **38**.
- 30     Compounds **36a** and **b** are prepared upon reaction of compound **35**, in the presence of ZnCl<sub>2</sub> and bis(triphenylphosphine) palladium (II) chloride,

with vinylmagnesium bromide, or 2-bromo-propene and n-butyl lithium, respectively.

The  $3\alpha$  compounds are obtained by identical chemistry. Also, the enantiopure end-products required are carried through identical chemistry for  $3\alpha$  and  $3\beta$  diastereomers starting with enantiopure compound 35 obtained from enantiopure ketones (**1R**)-45 and (**1S**)-45. Conformational and configurational assignments demonstrate that the carbomethoxy is in the  $2\beta$ -configuration. Further, the  $3\alpha$  vs.  $3\beta$  conformers are readily identified.

A comparison of the binding potency of the 8-oxabicycles with the 8-azabicycles shows that, although the most potent in both classes are almost equipotent ( $IC_{50}=1-3$  nM), the less potent compounds ( $R=H, F$ ) are typically weaker in the 8-oxa than 8-aza series.

The enol triflate is reacted with the appropriate poly-aromatic boronic acids (Thompson, W. J. and J. Gaudino (1984), *J. Org. Chem.* **49**: 5237-5243) to provide the 2,3-enes.  $Sml_2$  reduction gives  $3\alpha$  and  $3\beta$  conformers:

VII.

20

where  $X$  is an oxygen atom or a carbon group,  $Ar$  is preferably 4-substituted phenyl, naphthyl, anthracenyl or phenanthrenyl and  $R$  is preferably lower alkyl, lower alkoxy or amino, as defined above. The compounds are prepared as racemates and pairs of enantiomers.

Enantiomers and diastereomers can be separated by silica gel chromatography using 2% ammonia in ethyl acetate as the eluent, or other solvent systems as necessary. Compounds from the above series are hydrolyzed ( $LiOH$ ) and treated with oxalyl chloride followed by amines such as

morpholine or piperidine to provide amides.

2,3- (and 3,4-) Unsaturated 8-aza- and 8-oxa-tropes are additional preferred embodiments of the present invention. Examples of preferred such compounds have the following formula:

5 VIII.

10

15

where X is preferably oxygen, N-alkyl or a carbon moiety, R is preferably morpholinyl, piperidinyl or methoxy, Ar is preferably phenyl or naphthyl either of which can be substituted with halogen, alkenyl having 2-8 carbon atoms or alkynyl having 2-8 carbon atoms such as, for example, 4-Cl, 4-F, 4-Br, 4-I, 3,4-Cl<sub>2</sub>, ethenyl, propenyl, butenyl, propynyl, butynyl, etc.

The synthesis of the 2,3-unsaturated 8-aza- and 8-oxa-tropes is exemplified in Scheme 6 (see FIG. 6). The 3-(substituted aryl)-8-oxabicyclo(3.2.1)octanes can be obtained from the keto ester 45.

25 Thus, 2,5-dimethoxytetrahydrofuran 43 is reacted with 1,3-bis(trimethylsiloxy)-1-methoxybuta-1,3-diene 44 in CH<sub>2</sub>Cl<sub>2</sub> in the presence of TiCl<sub>4</sub> to give the ketone 45. The ketone 45 is then converted to compound 46 by reaction with N-phenyltrifluoromethanesulfonimide and sodium bis(trimethyl-silyl)amide in THF. The enol triflate 46 is coupled with 30 arylboronic acids in the presence of tris(dibenzylidene-acetone)dipalladium(0) to provide the aryl octenes 47.

Compounds **47e** and **f** are synthesized from enantiopure compound **(1R)-45** and compound **(1S)-45**. Alternatively, a diastereomeric mixture of enol camphanates is prepared upon reaction of compounds **(1R/S)-45** with **(S)-(-)-camphanyl chloride** in THF. recrystallization from  $\text{CH}_2\text{Cl}_2/\text{hexane}$  then gives the pure diastereomer **(1R)-enol camphanate** as evidenced by NMR. The residual mixture of enol camphanate diastereomers is treated with LiOH to produce compounds **(1R/1S)-45** which is then reacted with **(R)-(+)-camphanyl chloride**. recrystallization of this enol camphanate then gives the pure **(1S)-enol camphanate diastereomer**. Quantitative hydrolysis of the enantiomerically pure individual camphanate esters with LiOH provides ketones **(1S)-45** and **(1R)-45** (chiral HPLC OC column: **(1R)-45** and **(1S)-45** >96% ee for each of the enantiomers). The purified enantiomers are then subjected to the sequence of steps described earlier to obtain the enantiomerically pure 8-oxatropene analogs, **27e** and **f** (see Scheme 3, FIG.3).

Absolute configuration was confirmed by X-ray structural analysis. Isomerization of the 2,3-ene to provide the 3,4-enes is achieved with base. Biological data for representative 2,3-enes of the present invention having a 3-(3,4-dichlorophenyl) substituent are shown in Table 2.

**Table 2.** Inhibition of  $^3\text{H}-\text{WIN}35,428$  binding to the DAT and  $^3\text{H}$ -citalopram binding to the SERT in cynomolgus monkey caudate-putamen.

Compound	R/S	IC <sub>50</sub> (nM)		Selectivity	
		DAT	SERT	DAT/SERT	
<b>47e</b>	8-0	(1R)	4.6	2,120	461
<b>47f</b>	8-0	(1S)	58.2	46,730	802
<b>48</b>	8-NCH <sub>3</sub>	(1R)	1.1	867	790

The (*1R*) enantiomer **47e** binds potently to the DAT ( $IC_{50} = 4.6$  nM) and very weakly at the SERT ( $IC_{50} = 2,120$  nM) and is ca. 460-fold selective. Surprisingly and unexpectedly, the (*1S*) enantiomer **47f** retains potency (DAT:  $IC_{50} = 58.2$  nM) and substantial selectivity DAT/SERT = 800). The 8-amine 5 analogs of these compounds can be prepared *via* analogous enol triflate chemistry. Thus, 2-carbomethoxytropoane-2-one is similarly converted to its enol triflate and coupled with 3,4-dichlorophenyl boronic acid to provide compound **48**. Compound **48** is among the most potent and selective (790-fold) compounds (DAT  $IC_{50} = 1.1$  nM; SERT  $IC_{50} = 867$  nM). These compounds offer 10 an opportunity to differentiate binding to the SERT vs. the DAT, as well as to take advantage of the different biological profiles (biological  $t_{1/2}$ , toxicity, metabolism) that these compounds offer.

In accord with another preferred embodiment of the present invention, the 2,3- (and 3,4-) didehydro tropanes and 8-oxatropanes have been 15 hydroxylated or alkoxylated at the 6- and 7- positions to provide compounds capable of intramolecular hydrogen bonding to the 8-oxa and 8-aza positions. The selectivity observed in the 2,3-ene and the 7-OH compounds provides synergism and offers extremely potent and selective compounds. The  $7\beta$ -hydroxy tropanes **10** and **11** are potent and selective. The (*1R*) 2,3-ene 20 enantiomer **47e** binds potently and selectively to the DAT and the (*1R*) 8-aza-2,3-ene **48** is among the most potent and selective DAT inhibitors. Compounds exhibiting both functionalities are particularly preferred. The conversion of an enol triflate *via* Suzuki coupling with appropriate arylboronic acids provides the preferred compounds (see also Scheme 1, FIG. 1). Such 25 compounds, i.e., bicyclo(3.2.1)octanes, include compounds having the following formula:

IX.

where X is preferably O, NCH<sub>3</sub> or CH<sub>2</sub>, R is preferably morpholinyl, piperidinyl or methoxy, R<sub>2</sub> is preferably hydroxy or methoxy in the 6- or 7- position, Ar is preferably phenyl or naphthyl either of which can be substituted with halogen, alkenyl having 2-8 carbon atoms or alkynyl having 2-8 carbon atoms such as, for example, 4-Cl, 4-F, 4-Br, 4-I, 3,4-Cl<sub>2</sub>, ethenyl, propenyl, butenyl, propynyl, butynyl, etc.

These compounds can be prepared either as free bases or as a pharmacologically active salt thereof such as hydrochloride, tartrate, sulfate, naphthalene-1,5-disulfonate or the like.

The present invention also provides pharmaceutical compositions, preferably comprising the compounds of the present invention in a pharmaceutically acceptable carrier. Pharmaceutically acceptable carriers are well known to those skilled in the art. In a preferred embodiment, the pharmaceutical composition is a liquid composition in pyrogen-free, sterilized container or vial. The container can be unit dose or multidose.

The compounds and pharmaceutical preparations of the present invention can be used to inhibit the %hydroxytryptamine reuptake of a monoamine transporter, particularly reuptake by the dopamine transporter, serotonin transporter or norepinephrine transporter. An effective dose of the compound is administered to a patient based on IC<sub>50</sub> values determined in vitro. The route of administration can be varied but is principally selected from intravenous, nasal and oral routes. The effective dose can vary depending upon the mode of administration as is well known in the art.

Dysfunction of dopamine neurons has been implicated in several neuropsychiatric diseases. Imaging of the dopamine neurons offers important clinical information relevant to diagnosis and therapeutic treatments.

Dopamine neurons produce dopamine, release the neurotransmitter and remove the released dopamine with a dopamine transporter protein.

Compounds that bind to the dopamine transporter are effective measures of dopamine neurons and can be transformed into imaging agents for PET and for SPECT imaging. In identifying a suitable compound for the dopamine transporter, an essential first step is to measure the affinity and selectivity of a candidate at the dopamine transporter. The affinity is measured by conducting radioreceptor assays. A radiolabeled marker for the transporter, e.g., (<sup>3</sup>H)WIN 35,428, is incubated with the unlabeled candidate and a source of the transporter, usually brain striatum. The effect of various concentrations of the candidate on inhibiting (<sup>3</sup>H)WIN 35,428 binding is quantified. The concentration of the compound that inhibits 50% of (<sup>3</sup>H)WIN 35,428 bound to the transporter ( $IC_{50}$  value) is used as a measure of its affinity for the transporter. A suitable range of concentrations of the candidate typically is 1 – 10 nM.

It is also important to measure the selectivity of the candidate of the dopamine compared with the serotonin transporter. The serotonin transporter is also detectable in the striatum, the brain region with the highest density of dopamine neurons and in brain regions surrounding the striatum. It is necessary to determine whether the candidate compound is more potent at the dopamine than the serotonin transporter. If more selective (>10-fold), the probe will permit accurate measures of the dopamine transporter in this region of interest or will provide effective treatment modality for the dopamine transporter. Therefore, a measure of probe affinity of the serotonin transport is conducted by assays paralleling the dopamine transporter assays. (<sup>3</sup>H)Citalopram is used to radiolabel binding sites on the serotonin transporter and competition studies are conducted with the candidate compound at various concentrations in order to generate an  $IC_{50}$  value.

This invention will be illustrated further by the following examples. These examples are not intended to limit the scope of the claimed invention in any manner. The Examples provide suitable methods for preparing compounds of the present invention. However, those skilled in the art may

make compounds of the present invention by any other suitable means. As is well known to those skilled in the art, other substituents can be provided for the illustrated compounds by suitable modification of the reactants.

All exemplified target compounds are fully analyzed (mp, TLC, CHN, GC  
5 and/or HPLC) and characterized (<sup>1</sup>H NMR, <sup>13</sup>C NMR, MS, IR) prior to submission for biological evaluation. The affinity of all the compounds for the DAT, SERT and NET are measured. NMR spectra are recorded on a Bruker 100, a Varian XL 400, or a Bruker 300 NMR spectrometer. Tetramethylsilane ("TMS") is used as internal standard. Melting points are uncorrected and are  
10 measured on a Gallenkamp melting point apparatus. Thin layer chromatography (TLC) is carried out on Baker Si 250F plates. Visualization is accomplished with iodine vapor, UV exposure or treatment with phosphomolybdic acid (PMA). Preparative TLC is carried out on Analtech uniplates Silica Gel GF 2000 microns. Flash chromatography is carried out on  
15 Baker Silica Gel 40mM. Elemental Analyses are performed by Atlantic Microlab, Atlanta, GA and are within 0.4% of calculated values for each element. A Beckman 1801 Scintillation Counter is used for scintillation spectrometry. 0.1% Bovine Serum Albumin ("BSA") and (-)-cocaine is purchased from Sigma Chemicals. All reactions are conducted under an inert  
20 (N<sub>2</sub>) atmosphere.

<sup>3</sup>H-WIN 35,428 (<sup>3</sup>H-CFT, 2β-carbomethoxy-3β-(4-fluorophenyl)-N-<sup>3</sup>H-methyltropane, 79.4-87.0 Ci/mmol) and <sup>3</sup>H-citalopram (86.8 Ci/mmol) is purchased from DuPont-New England Nuclear (Boston, MA). (R)-(-)-Cocaine hydrochloride for the pharmacological studies was donated by the National  
25 Institute on Drug Abuse (NIDA). Fluoxetine was donated by E. Lilly & Co. HPLC analyses are carried out on a Waters 510 system with detection at 254 nm on a Chiralcel OC column (flow rate: 1 mL/min).

30 **Example 1. (1*R*,1*S*)-2-Carbomethoxy-8-oxabicyclo(3.2.1)octanone**

To 2,5-dimethoxytetrahydrofuran (39.6 g, 0.3 mol) in CH<sub>2</sub>Cl<sub>2</sub> (anhydrous,

200 mL) at -78° C under nitrogen was added TiCl<sub>4</sub> (66 mL, 0.6 mol). After stirring for 30 min, 1,3-bis(trimethyl-siloxy)-1-methoxybuta-1,3-diene, **2**, (Chan, T.-H. and P. Brownbridge (1980), *J. Am. Chem. Soc.* **102**: 3534-3538; Danishefsky, S. and T. Kitahara (1974), *J. Am. Chem. Soc.* **96**: 7807-7808) (78 g, 5 0.3 mol) in CH<sub>2</sub>Cl<sub>2</sub> (anhydrous, 400 mL) was added at a rate such that the internal temperature was maintained below -55° C. The mixture was stirred for 3 h. Saturated NaHCO<sub>3</sub> was added until the mixture was neutral to pH paper. The aqueous layer was extracted with ether (3 x 1 L). The dried (MgSO<sub>4</sub>) combined organic layers were concentrated on a rotavaporator. The residue 10 was purified by flash chromatography (20% EtOAc/hexanes) to afford 20.5 g (37%) of **3** as a light brown oil.

**Example 2.** (1*R*,1*S*)-2-Carbomethoxy-3-{{(trifluoromethyl)-sulfonyl}oxy}-8-oxabicyclo(3.2.1)-2-octene

15 Sodium bistrimethylsilylamide (1.0 M solution in THF, 45 mL) was added dropwise to 2-carbomethoxy-8-oxabicyclo(3.2.1) octanone, **3**, (Brownbridge, P. and T.-H. Chan (1979), *Tet. Lett.* **46**: 4437-4440) (7.12 g, 38.65 mmol) in THF (100 mL) at -70° C under nitrogen. After stirring for 30 min, N-phenyltrifluoromethanesulfonimide (15.19 g, 42.52 mmol) was added as a solid at -70° C. The 20 reaction was allowed to warm to room temperature and was then stirred overnight. The volatiles were removed on rotavaporator. The residue was dissolved in CH<sub>2</sub>Cl<sub>2</sub> (200 mL) and washed with H<sub>2</sub>O (100 mL) and brine (100 mL). The dried (MgSO<sub>4</sub>) CH<sub>2</sub>Cl<sub>2</sub> layer was concentrated to dryness on rotavaporator. The residue was purified by flash chromatography (10% 25 EtOAc/hexanes) to afford 9.62 g (79%) of **4** as a pale yellow oil.

20 **6(7)-methoxy-2-methoxycarbonyl-8-azabicyclo-[3.2.1]octane-2-one;**

To a solution of 60 ml of acetic acid and 43 ml of acetic anhydride at 0°C, was added slowly 40 g (0.27 mol) of acetone-dicarboxylic acid. The 25 mixture was stirred and the temperature was not allowed to rise above 10°C. The acid was dissolved slowly and a pale yellow precipitate formed. After 3 h the product was filtered, washed with 30 ml of glacial acetic acid and 100 ml of benzene. The white powder obtained was dried at high vacuum to afford 30 g of acetonedicarboxylic acid anhydride (yield 86%). Mp 137-138°C.

30 To a flask containing 50 g (0.39 mol) of acetone-dicarboxylic acid anhydride was added 160 ml of cold dry MeOH. The monomethylester solution was allowed to stand for 1 h and filtered. The filtrate of

acetonedicarboxylic acid monomethyl ester was used directly in the following condensation reaction.

To a 3 L flask with 53.6 g (0.41 mol) of 2,5-dimethoxy-dihydrofuran was added 1000 ml of 3N HCl solution. The mixture was left to stand for 12h at room temperature and then neutralized with ice-cold NaOH solution (equal moles) at 0°C. To this red solution, was added 41.3 g (0.62 mol) of methylamine hydrochloride in 300 ml H<sub>2</sub>O, the preformed methanol solution of the monomethylester (50g (0.39 mol) of acetone dicarboxylic acid anhydride in 160 ml of methanol) and 50 g of sodium acetate in 200 mL of H<sub>2</sub>O. The mixture (pH 4.5) was stirred for 2 days and the acidity decreased to pH 4.9. The red solution was extracted with hexane (450 ml X 2) to remove nonpolar by-products. The aqueous solution was basified first with NaOH (1N) to neutral pH, then with potassium carbonate. Sodium chloride (about 200 g) was added. The saturated solution was extracted with CH<sub>2</sub>Cl<sub>2</sub> (250 ml x 8), then with a mixed solvent (t-butyl:1,2-dichloroethane, 37:63, 250 ml x 8). The CH<sub>2</sub>Cl<sub>2</sub> extracted was dried over K<sub>2</sub>CO<sub>3</sub> and solvent was removed to provide 19.6 g of a crude mixture which was separated by column chromatography (SiO<sub>2</sub>, 10% Et<sub>3</sub>N, 30-90% EtOAc in hexane and 10% methanol in EtOAc) to afford 7.5 g of 6(7)-methoxy-2-methoxycarbonyl-8-azabicyclo(3.2.1)octane-2-one as an oil and 7g of 6(7)-hydroxy-2-methoxycarbonyl-8-azabicyclo-(3.2.1)octane-2-one as a crystalline solid.

The mixed solvent extracts were dried and removed in vacuo to afford a pale yellow solid 19.2 g: 6(7)-hydroxy-2-methoxy-carbonyl-8-azabicyclo(3.2.1)octane-2-one. The hydroxy tropanones were used without further purification.

5 **Monoamine inhibition studies.**

Biological assays were performed using the following procedures.

A. **Tissue sources and preparation.**

- Brain tissue from adult male and female cynomolgus monkeys (*Macaca fascicularis*) is stored at -85°C in the primate brain bank at the New England  
10 Regional Primate Research Center. The caudate-putamen will be dissected from coronal slices and yields 1.4 ± 0.4 g tissue. Membranes are prepared as described previously. Briefly, the caudate-putamen is homogenized in 10 volumes (w/v) of ice-cold Tris.HCl buffer (50 mM, pH 7.4 at 4°C) and centrifuged at 38,000 x g for 20 min in the cold. The resulting pellet is  
15 suspended in 40 volumes of buffer, and the entire procedure is repeated twice. The membrane suspension (25 mg original wet weight of tissue/ml) is diluted to 12 ml/ml for <sup>3</sup>H-WIN 35,428 or <sup>3</sup>H-citalopram assay in buffer just before assay and is dispersed with a Brinkmann Polytron homogenizer (setting #5) for 15 sec. All experiments are conducted in triplicate and each  
20 experiment is repeated in each of 2 - 3 preparations from individual brains.

**B. Dopamine transporter assay.**

The dopamine transporter is labeled with  $^3\text{H}$ -WIN35,428 (70 - 85 Ci/mmol, DuPont-NEN). The affinity of novel compounds for the dopamine transporter will be determined in experiments by

- 5 incubating tissue with a fixed concentration of  $^3\text{H}$ -WIN35,428 and a range of concentration of the compound as previously described (Madras, 1989 #21). Stock solutions are diluted serially in the assay buffer and added (0.2 mL) to the assay medium. The assay tubes receive, in Tris.HCl buffer (50 mM, pH 7.4 at 0 - 4°C; NaCl 100 mM), the following constituents at a final assay
- 10 concentration: drug (0.2 ml; 1 pM - 300  $\mu\text{M}$ , depending on affinity),  $^3\text{H}$ -WIN35,428 (0.2 ml; 0.3 or 1 nM); membrane preparation (0.2 ml; 1-4 mg original wet weight of tissue/ml), depending on the assay. The 2 h incubation (0 - 4°C) is initiated by addition of membranes and terminated by rapid filtration over Whatman GF/B glass fiber filters pre-soaked in 0.1% bovine serum
- 15 albumin (Sigma Chem. Co.). The filters are washed twice with 5 ml Tris.HCl buffer (50 mM), incubated overnight at 0 - 4°C in scintillation fluor (Beckman Ready-Value, 5 ml) and radioactivity (dpm) is measured by liquid scintillation spectrometry (Beckman 1801). Total binding is defined as  $^3\text{H}$ -WIN35,428 bound in the presence of ineffective concentrations of the drug. Non-specific
- 20 binding is defined as  $^3\text{H}$ -WIN35,428 bound in the presence of an excess (30  $\mu\text{M}$ ) of (-)-cocaine or mazindol (1  $\mu\text{M}$ ). Specific binding is the difference between the two values.

**C. Serotonin transporter assay.**

- 25 The serotonin transporter is labeled by  $^3\text{H}$ -citalopram (spec. act.: 82 Ci/mmol, DuPont-NEN). The serotonin transporter is assayed in caudate-putamen membranes using conditions similar to those for the dopamine transporter. The serotonin transporter is expressed at relatively high density in the caudate-putamen (20 pmol/g) and the affinity of  $^3\text{H}$ -citalopram is approximately 2nM. Drug affinities are determined by incubating tissue with a fixed concentration of  $^3\text{H}$ -citalopram and a range of concentrations of the test

compounds. The assay tubes receive, in Tris.HCl buffer (50 mM, pH 7.4 at 0 - 4°C; NaCl 100 mM), the following constituents at a final assay concentration: drug (0.2 ml of various concentrations);  $^3\text{H}$ -citalopram (0.2 ml; 1 nM); membrane preparation (0.2 ml; 4 mg original wet weight of tissue/ml). The 2 h 5 incubation (0 - 4°C) is initiated by addition of membranes and terminated by rapid filtration over Whatman GF/B glass fiber filters pre-soaked in 0.1% polyethyleneimine. The filters are washed twice with 5 ml Tris.HCl buffer (50 mM) and the remaining steps are carried out as described above. Total binding is defined as  $^3\text{H}$ -citalopram bound in the presence of ineffective concentrations 10 of unlabeled citalopram (1pM) or the test compounds. Non-specific binding is defined as  $^3\text{H}$ -citalopram bound in the presence of an excess (10  $\mu\text{M}$ ) of fluoxetine. Specific binding is the difference between the two values.

**D. Norepinephrine transporter assay.**

15 The selection of thalamus is based on a previous autoradiographic study reporting this brain region to have high densities of  $^3\text{H}$ -nisoxetine. The assay conditions for thalamus membranes (Madras 1996) are similar to those for the serotonin transporter. The affinity of  $^3\text{H}$ -nisoxetine (spec. act.: 74 Ci/mmol, DuPont-NEN) for the norepinephrine transporter is determined in experiments 20 by incubating tissue with a fixed concentration of  $^3\text{H}$ -nisoxetine and a range of concentrations of unlabeled nisoxetine. The assay tubes receive the following constituents at a final assay concentration: nisoxetine or drug (0.2 ml; 1pM - 300  $\mu\text{M}$ ),  $^3\text{H}$ -nisoxetine (0.2ml; 0.6nM); membrane preparation (0.2ml; 4mg original wet weight of tissue/ml). The buffer in the assay medium is Tris.HCl: 25 50mM, pH 7.4 at 0-4°C; NaCl 300mM. The 16 h incubation at 0-4°C is initiated by addition of membranes and terminated by rapid filtration over Whatman GF/B glass fiber filters pre-soaked in 0.1% polyethyleneimine. The remaining steps are described above. Total binding is defined as  $^3\text{H}$ -nisoxetine bound in the presence of ineffective concentrations of drug. Non-specific binding is 30 defined as  $^3\text{H}$ -nisoxetine bound in the presence of an excess (10  $\mu\text{M}$ ) of desipramine. Specific binding is the difference between the two values.

**E. Data Analysis.**

5 Data are analyzed by EBDA and LIGAND computer software (Elsevier-Biosoft, UK) Final estimates of IC<sub>50</sub> and nH values are computed by the EBDA program. Baseline values for the individual drugs are established by computer analysis using the baseline drugs as guide. The LIGAND program provides final parameter estimates of the novel compounds by iterative non-linear curve-fitting and evaluation of one- or two-component binding models.

wherein:

25  $R_1 = COOCH_3, COR_3, \text{lower alkyl}, \text{lower alkenyl}, \text{lower alkynyl}, CONHR_4,$   
or  $COR_6;$

$R_2 =$  is a  $6\alpha, 6\beta, 7\alpha$  or  $7\beta$  substituent, which can be selected from  $OH,$   
 $OR_3, F, Cl, Br,$  and  $NHR_3;$

$X = NR_3, CH_2, CHY, CYY_1, CO, O, S; SO, SO_2, NSO_2R_3,$  or  $C=CX_1Y;$

30  $X_1 = NR_3, CH_2, CHY, CYY_1, CO, O, S; SO, SO_2,$  or  $NSO_2R_3;$

$R_3 = H, CH_3, CH_3CH_2, CH_3(CH_2)_n (CH_2)_nC_6H_4Y, C_6H_4Y,$   $CHCH_2,$  lower

alkyl, lower alkenyl, or lower alkynyl;

Y and Y<sub>1</sub> = H, Br, Cl, I, F, OH, OCH<sub>3</sub>, CF<sub>3</sub>, NO<sub>2</sub>, NH<sub>2</sub>, CN, NHCOCH<sub>3</sub>, N(CH<sub>3</sub>)<sub>2</sub>, (CH<sub>2</sub>)<sub>n</sub>CH<sub>3</sub>, COCH<sub>3</sub>, or C(CH<sub>3</sub>)<sub>3</sub>;

R<sub>4</sub> = CH<sub>3</sub>, CH<sub>2</sub>CH<sub>3</sub>, or CH<sub>3</sub>SO<sub>2</sub>;

5 Ar = phenyl-R<sub>5</sub>, naphthyl-R<sub>5</sub>, anthracenyl-R<sub>5</sub>, phenanthrenyl-R<sub>5</sub>, or diphenylmethoxy-R<sub>5</sub>;

R<sub>5</sub> = Br, Cl, I, F, OH, OCH<sub>3</sub>, CF<sub>3</sub>, NO<sub>2</sub>, NH<sub>2</sub>, CN, NHCOCH<sub>3</sub>, N(CH<sub>3</sub>)<sub>2</sub>, (CH<sub>2</sub>)<sub>n</sub>CH<sub>3</sub>, COCH<sub>3</sub>, C(CH<sub>3</sub>)<sub>3</sub> where n= 0-6, 4-F, 4-Cl, 4-I, 2-F, 2-Cl, 2-I, 3-F, 3-Cl, 3-I, 3,4-diCl, 3,4-diOH, 3,4-diOAc, 3,4-diOCH<sub>3</sub>, 3-OH-4-Cl, 3-OH-4-F,

10 3-Cl-4-OH, 3-F-4-OH, lower alkyl, lower alkoxy, lower alkenyl, lower alkynyl, CO(lower alkyl), or CO(lower alkoxy);

R<sub>6</sub> = morpholinyl or piperidinyl;

m = 0 or 1;

n = 0, 1, 2, 3, 4 or 5; and

15 when X = O, CH<sub>2</sub>, CHY, CY<sub>1</sub>, CO or C=CX<sub>1</sub>Y, R<sub>2</sub> can be H; except that when X = N, R<sub>1</sub> is not COR<sub>6</sub>.

2. The compound of claim 1 having the following structural formula:

20 IV.

25

wherein X, Ar, R<sub>2</sub> and m have the same meaning as defined above.

3. The compound of claim 2, wherein X is N, R<sub>2</sub> is hydroxy or methoxy, and Ar is phenyl, substituted phenyl, diarylmethoxy or substituted diarylmethoxy.

4. The compound of claim 3, wherein the substituent is a halogen.
5. The compound of claim 3, wherein Ar is a mono- or di-halogen substituted phenyl,
6. The compound of claim 2, wherein the aryl ring can be substituted with one or more halide atoms, hydroxy groups, nitro groups, amino groups, cyano groups, lower alkyl groups having from 1-8 carbon atoms, lower alkoxy groups having from 1-8 carbon atoms, lower alkenyl groups having from 2-8 carbon atoms, or lower alkynyl groups having from 2-8 carbon atoms.
7. The compound of claim 6, wherein the aryl ring can be substituted with chloride or iodide.
8. The compound of claim 6, wherein the amino group is a mono- or di- alkyl substituted group having from 1-8 carbon atoms.
9. The compound of claim 2, wherein the aryl group has a substituent selected from the group consisting of Br, Cl, I, F, OH, OCH<sub>3</sub>, CF<sub>3</sub>, NO<sub>2</sub>, NH<sub>2</sub>, CN, NHCOCH<sub>3</sub>, N(CH<sub>3</sub>)<sub>2</sub>, COCH<sub>3</sub>, C(CH<sub>3</sub>)<sub>3</sub>, (CH<sub>2</sub>)<sub>n</sub>CH<sub>3</sub> where n= 0-6, allyl, isopropyl and isobutyl.
10. The compound of claim 2, wherein the aryl group has a substituent selected from the group consisting of lower alkyl, lower alkenyl and lower alkynyl.
11. The compound of claim 2, wherein the aryl group is substituted with a member of the group consisting of 4-F, 4-Cl, 4-I, 2-F, 2-Cl, 2-I, 3-F, 3-Cl, 3-I, 3,4-diCl, 3,4-diOH, 3,4-diOAc, 3,4-diOCH<sub>3</sub>, 3-OH-4-Cl, 3-OH-4-F,

3-Cl-4-OH and 3-F-4-OH.

12. The compound of claim 1 having the following structural formula:

5 V.

10

where R is H, 4-F, 4-Cl, 4-Br, 4-I or 4-CH<sub>3</sub>.

13. The compound of claim 12, wherein the aryl group is a 3,4-dihalo substituted phenyl.

14. The compound of claim 13, wherein the aryl group is 3,4-dichlorophenyl.

20

15. The compound of claim 1 having the following structural formula:

VI.

25

where X is an oxygen or a carbon atom, and R is a lower alkenyl or lower alkynyl group having from about 2 to about 8 carbon atoms.

16. The compound of claim 15 wherein the lower alkenyl or lower alkynyl group is selected from the group consisting of ethenyl, propenyl, butenyl, propynyl and butynyl.

5 17. The compound of claim 1 having the following structural formula  
VII.

10

where X is an oxygen atom or carbon group and Ar is 4-substituted phenyl, naphthyl, anthracenyl or phenanthrenyl.

15

18. The compound of claim 1 having the following structural formula:

VIII.

20

25 where X is oxygen, N-alkyl or a carbon group, R<sub>1</sub> is morpholinyl, piperidinyl or methoxy, Ar is phenyl, substituted phenyl, naphthyl or substituted naphthyl.

30 19. The compound of claim 18, wherein Ar is substituted with halogen, lower alkenyl having 2-8 carbon atoms or lower alkynyl having 2-8 carbon atoms.

20. The compound of claim 18, wherein Ar is substituted with 4-Cl, 4-F, 4-Br, 4-I, 3,4-Cl<sub>2</sub>, ethenyl, propenyl, butenyl, propynyl or butynyl.

21. The compound of claim 1 having the following structural  
5 formula:

IX.

10

where X is O, CH<sub>2</sub> or NCH<sub>3</sub>, R<sub>1</sub> is morpholinyl, piperidinyl or methoxy, R<sub>2</sub> is hydroxy or methoxy in the 6- or 7- position, Ar is phenyl or naphthyl either of which can be substituted with halogen, alkenyl having 2-8 carbon atoms or alkynyl having 2-8 carbon atoms.

22. The compound of claim 21, wherein Ar is substituted with 4-Cl, 4-F, 4-Br, 4-I, 3,4-Cl<sub>2</sub>, ethenyl, propenyl, butenyl, propynyl or butynyl.

20

23. The compound of claim 1 selected from the group consisting of:

- a. (1R,1S)-2-carbomethoxy-3-((trifluoromethyl)-sulfonyloxy)-8-oxabicyclo(3.2.1)-2-octene;
- b. (1R,1S)-2-carbomethoxy-3-phenyl-8-oxabicyclo(3.2.1)-2-octene;

## INTERNATIONAL SEARCH REPORT

International application No. PCT/US98/14326
---

**Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)**

This international report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1.  Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely:
  
  
  
2.  Claims Nos.: because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
  
  
  
3.  Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

**Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)**

This International Searching Authority found multiple inventions in this international application, as follows:

Please See Extra Sheet.

1.  As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2.  As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3.  As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
  
  
  
4.  No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

**Remark on Protest**

The additional search fees were accompanied by the applicant's protest.

No protest accompanied the payment of additional search fees.

**BOX II. OBSERVATIONS WHERE UNITY OF INVENTION WAS LACKING**  
This ISA found multiple inventions as follows:

Group I, claim(s) 1-11, and 18-26, drawn to a compound of formula I, II, or III where X is N; e.g. azabicyclo octanes.

Group II, claim(s) 1, 2, 6-24, and 26, drawn to a compound of formula I, II, or III where X is O; e.g. oxabicyclo octanes.

Group III, claim(s) 1, 2, 6-11, and 15-22, drawn to a compound of formula I, II, or III where X is a carbon group; e.g. non-heterocyclic bicyclo octanes.

The inventions listed as Groups I-III do not relate to a single inventive concept under PCT Rule 13.1 because, under PCT Rule 13.2, they lack the same or corresponding special technical features for the following reasons: all of the compounds share a N, O, or C as the bridging atom which is known in the art.

The inventions of groups I-III vary since there is no common core among the compounds due to the variation among the bridging atom, X, in the bicyclo ring system; e.g. the ring system can vary among azabicyclo, oxabicyclo, and hydrocarbon bicyclo octanes.
